cc survival, differentiation, activity, morphology, or movement/migration color, e.g. T cells and cells of the heart, liver, pancreas, placenta, cc brain, lung, skeletal muscle, kidney, spleen, lymph node, peripheral cc blood leukocyte, bone marrow or thymus tissue. They can be used as condulating agents for regulating cellular processes, thus, the proteins cc and their associated nucleic acids can be used to prognosticate, prevent, cc diagnose, or treat disorders associated with physiological processes. Cc These disorders include abnormal blood coagulation, asthma, anaphylaxis, cc thepatitis, multiple sclerosis, cancer, coronary artery disease, malaria, catopic dermatitis, amyotrophic lateral sclerosis, maningitis, attention cc deficit disorder, Crohn's disease, gastroenteritis, goitre, hypoglycaemia, diabetes mellitus, endometriosis, pulmonary embolism and cmuscular dystrophy, Antibodies to disorders such as these can be made by providing a polypeptide of the invention to an immuno-competent cycretebrate and harvesting blood or serum from the vertebrate.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Key

CUB proteins have been associated with regulating development, modulating cellular processes and preventing infectious disease. NHP nucleotide sequences are useful for gene therapy of physiological disorders or diseases. NHP oligonucleotides are useful as hybridisation probes for screening libraries and assessing gene patterns. NHP nucleotide sequences are useful for detecting mutant or cinappropriately expressed NHPs (for example, those proteins associated with obesity, high blood pressure, connective tissue disorders and cinfertility) for the diagnosis of a disease. The polynucleotides may also be used in screening for drugs effective in the treatment of symptomatic cor phenotypic manifestations of perturbing the normal function of NHP in the body. Nucleotide constructs encoding NHP products are used to construct supplies thost cells allow for the identification of compounds that bind to NHP creeptors or trigger NHP-mediated pathways.

                                                                                                                                                                                                                                                                                        patterns. NHP nucleotide sequences are useful for detecting mutant or inappropriately expressed NHPs (for example, those proteins associated with obesity, high blood pressure, connective tissue disorders and infertility) for the diagnosis of a disease. The polynucleotides may also be used in screening for drugs effective in the treatment of symptomatic or phenotypic manifestations of perturbing the normal function of NHP in the hody. We consider the continuous conditions are the polynucleotide continuous of perturbing the normal function of NHP in the hody.
                                                                                                                                                                                                                                                                                                                                                                              The sequence represents a novel human protein (NHP) containing a CUB domain (an extracellular domain). CUB proteins have been associated with regulating development, modulating cellular processes and preventing infectious disease. NHP nucleotide sequences are useful for gene therapy of physiological disorders or diseases. NHP oligonucleotides are useful as hybridisation probes for screening libraries and assessing gene

         The sequence represents a novel human protein (NHP) containing a CUB domain (an extracellular domain). CUB proteins have been associated wit regulating development, modulating cellular processes and preventing infectious disease. NHP nucleotide sequences are useful for gene therap of physiological disorders or diseases. NHP oligonucleotides are useful as hybridisation probes for screening libraries and assessing gene

The polynucleotides may also be used in screening for drugs effective in the treatment of symptomatic or phenotypic manifestations of perturbing the normal function of NHP in the body. Nucleotide constructs encoding NHP products are used to genetically engineer host cells to express such products in vivo. These host cells allow for the identification of compounds that bind to NHP

Claim 3; Page 123-125; 152pp; English

The invention relates to neuropilin-like polypeptide (neuropilin-Hyl and CC neuropilin-Hyl) and their corresponding nucleic acids. The neuropilin-CC like polypeptides and polynucleotides are useful in modulating neuronal CC growth regenerative capacity, treating neurodegenerative diseases, CC diagnosing and mapping genetic neuronal defects and degenerative diseases (Clike Alzheimer's disease and for treating learning and memory disorders. CC They are also useful for inducing angiogenesis, neovascularisation, as CC well as organ growth and development e.g. heart and other tissues. CC Antagonists of neuropilin-like polypeptides are useful for treating cancers and other malignant diseases. Neuropilin is used to treat CC platelet disorders e.g. thrombocytopaenia, plastic anaemia and paroxysmal CC nocturnal haemoglobinuria and is used in nerve tissue growth or CC regeneration, in wound healing, tissue repair and replacement and in the conturnal haemoglobinuria and ulcers. Compositions comprising the CC sequences of the invention are useful for treating diseases of peripheral nervous system e.g. Parkinson's disease, Huntington's disease, Shy-Drager CC syndrome, amyotrophic lateral sclerosis, and traumatic disorders e.g. cmpositions conters, infections by hepatitis viruses, human immunodeficiency virus (HIV), herpes viruses, compositions by hepatitis viruses, human immunodeficiency virus (HIV), herpes viruses, culorimune pulmonary inflammation, autoimmune thyroiditis, diabetes inflammatory eye disease. The nucleic acids of the invention are used in classes. The nucleic acids of the invention are used in inflammatory eye disease. The nucleic acids of the invention are used gene therapy techniques. The present sequence is human neuropilin-Hyl protein. Neuropilin-Hyl gene is located on chromosome 6q21. 'n

                                              The invention relates to an isolated neuropilin-like polypeptide CC including neuropilin-Hy1 and neuropilin-Hy2, the full length cDNAs (CC encoding the proteins and the coding regions of the cDNAs. Also included CC is a nucleic acid array comprising the cDNAs attached to a surface used CC for detecting full-matches or mismatches to the cDNAs. The genes CC for neuropilin-Hy1 and Hy2 are located on human chromosome 6q21. CC The nucleic acid array is useful for detecting full-matches or mismatches CC to the cDNAs. The neuropilin-like proteins and encoding cDNAs are useful CC in modulating neuronal growth, regenerative capacity, treating CC neurodegenerative diseases, learning and memory disorders, diagnosing and CC mapping genetic neuronal defects and degenerative diseases like and compan growth and development (e.g. the heart). The nervous systems and clading traumatic lesions, ischaemic lesions, infectious lesions, including traumatic lesions, ischaemic lesions, infectious lesions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               11-SEP-2000;

For example, N and P may be used to treat disorders associated with decreased expression by rectifying mutations or deletions in a patient's genome that affect the activity of P by expressing inactive proteins or to supplement the patients own production of P. Additionally, N may be used to produce the colon cancer associated Ps, by inserting the nucleic acids into a host cell and culturing the cell to express the proteins. N and P can be used in the prevention, diagnosis and treatment of colorectal carcinomas and cancers. AAH37196 to AAH37204 and AAB77789 represent sequences used in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   N.B. Pages 666 to 682 and page 7053 of the sequence listing were missing at time of publication, meaning no sequences are present for SEQ ID NO:1027 to 1052, 7921 and 7922.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     the proteins are collectively known as colon cancer antigens. The cancer antigens have cytostatic activity and can be used in gene therapy and vaccine production. N and P may be used in the prevent diagnosis and treatment of diseases associated with inappropriate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Nucleic acids encoding 4277 human colon cancer-associated polypeptides, useful for preventing, diagnosing and/or treating colorectal cancers
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  cancer-associated nucleic acid

Novel isolated human Neuropilin-Hyl and Neuropilin-Hy2 polypeptides useful for treating neurodegenerative diseases e.g. Alzheimer's disease, and for diagnosing and mapping genetic neuronal defects

Claim 3; Page 128-130; 152pp; English

The invention relates to neuropilin-like polypeptide (neuropilin-Hyl and neuropilin-Hyl) and their corresponding nucleic acids. The neuropilin-like polypeptides and polypucleotides are useful in modulating neuronal growth regenerative capacity, treating neurodegenerative diseases. It is alzahemer's disease and for treating learning and memory diseases like Alzahemer's disease and for treating learning and memory diseases. They are also useful for inducing angiogenesis, neovascularisation, as well as organ growth and development e.g. heart and other tissues. Antagonists of neuropilin-like polypeptides are useful for treating cancers and other malignant diseases. Neuropilin is used to treat platelet disorders e.g. thrombocytopaenia, plastic anaemia and paroxysmal necturnal haemoglobinuria and is used in nerve tissue growth or regeneration, in wound healing, tissue repair and replacement and in healing of bones, incisions and ulcers. Compositions comprising the sequences of the invention are useful for treating diseases of peripheral nervous system e.g. Parkinson's disease, Huntington's disease, Shy-Drager syndrome, amyotrophic lateral sclerosis, and traumatic disorders e.g. spinal cord disorders, head trauma and cerebrovascular diseases e.g. multiple sclerosis, systemic lapus seythematosus, rheumatoid arthitis, autoimmune pulmonary inflammation, autoimmune thyroiditis, diabetes

neurodegenerative diseases, learning and memory disorders, diagnosing and mapping genetic neuronal defects and degenerative diseases like Alzhelmer's disease, for inducing angiogenesis, and neovascularisation and organ growth and development (e.g. the heart). The nervous system disorders include lesions of central or peripheral nervous systems, including traumatic lesions, inchaemic lesions, infectious lesions, degenerative lesions, lesions associated with nutritional diseases or disorders, neurological lesions, and lesions caused by toxic substances. The neuropilin-like proteins and cDNAs are also useful as markers for cancers. The neuropilin-like proteins are useful for regulating cell proliferation, cell differentiation, sem cell growth factor activity, for inducing proliferation of neural cells, regeneration of nerve and brain tissue, for treatment of central and peripheral nervous system diseases, and neuropathies, such as parkinson's disease, contains and peripheral nervous system tentior of a disease and neuropathies, such as parkinson's disease.
                                                                              Huntington's disease, amyotrophic lateral sclerosis, to regulate haematopoiesis and treat myeloid and lymphoid cell disorders, var. anaematas, and platelet disorders, such as thrombocytopaenia, regeneration and treatment of lung or liver fibrosis, reperfusion injury in various tissues and as a food supplement or molecular weight marker. The cDNAS are useful in gene identification, genome mapping, transgenics, as hybridisation probes, for primer design, gene chips and as a DNA antigen. The present sequence represents
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         for detecting full-matches or mismacures to the cDNAs. The neuropilin-lyl and Hy2 are located on human chromosome 6q21. The nucleic acid array is useful for detecting full-matches or mismatches to the cDNAs. The neuropilin-like proteins and encoding cDNAs are useful to the cDNAs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         including neuropilin-Hy1 and neuropilin-Hy2, the full length cDNAs encoding the proteins and the coding regions of the cDNAs. Also inc is a nucleic acid array comprising the cDNAs attached to a surface for detecting full-matches or mismatches to the cDNAs. The genes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to an isolated neuropilin-like polypeptide including neuropilin-Hy1 and neuropilin-Hy2, the full length cDN
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Claim 3; Page 123-125; 144pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention provides the protein and coding sequences of 444 novel human proteins. These were isolated from expressed sequences tags (ESTs). They can be used to stimulate cell growth, to regulate haematopoiesis e.g. to treat aplastic anaemia, to help tissue regrowth e.g. in burn treatment, to regulate the immune system e.g. to treat multiple sclerosis, to regulate activin or inhibin e.g. to treat infertility, to regulate haemostasis or thrombolysis e.g. to treat
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    stroke and cancer, to screen for drugs, to treat inflammatory conditions e.g. rheumatoid arthritis, and to treat nervous system disorders e.g. Parkinson's disease. The present sequence is a protein of the invention

Novel isolated human Neuropilin-Hyl and Neuropilin-Hyl polypeptides useful for treating neurodegenerative diseases e.g. Alzheimer's disease, and for diagnosing and mapping genetic neuronal defects -

Disclosure; Page 131-132; 152pp; English.

CC diagnosing and mapping genetic neuronal defects and degenerative diseases (CC like Alzheimer's disease and for treating learning and memory disorders.)

CC well as organ growth and development e.g. heart and other tissues.

CC Antagonists of neuropilin-like polypeptides are useful for treating CC cancers and other malignant diseases. Neuropilin is used to treat (CC platelet disorders e.g. thrombovytopeenia, plastic anaemia and paroxysmal (CC regeneration, in wound healing, tissue repair and replacement and in the healing of bones, inclsions and ulcers. Compositions comprising the composition of the invention are useful for treating the sequences of the invention are useful for treating the compositions system e.g. Parkinson's disease, Huntington's diseases, Shy-Drager (CC syndrome, amyotrophic lateral sclerosis, and traumatic disorders e.g. syndrome, amyotrophic lateral sclerosis, and traumatic disorders e.g. compositions viruses, human immunodeficiency virus (HIV), herpes viruses, myothockeria, Leishmania app., malaria app., autoimmune disorders e.g. compositions of the invention, autoimmune thyroiditis, diabetes (compositions systemic plumos erythematosus, rheumatoid arthitis, autoimmune pulmonary inflammation, autoimmune thyroiditis, diabetes (conformations) and users used in the invention are used in a folial of the invention are used in the properties of the invention are used in the inventi The invention relates to neuropilin-like polypeptide (neuropilin-Hy1 and neuropilin-Hy2) and their corresponding nucleic acids. The neuropilininflammatory neuropilin-Hy2) and their corresponding nucleic acids. The new like polypeptides and polynucleotides are useful in modulating eye disease. The nucleic acids of the invention neuronal

haematopoietic, heart and reproductive tissues. It has haemostatic and cerebroprotective activities. The F8H contains a Factor 5/8 signature and is useful as a therapeutic for treating cogulation related diseases such as haemophilia and stroke. The nucleic acid is useful as such as haemophilia and stroke. The nucleic acid is useful as hybridisation probe and amplification primer for detecting deficiencies in the level of F8H mRNA, for screening F8H gene mutations and for monitoring regulation of gene expression. Fragments of the nucleic acid are also useful as diagnostic probes and primers, and can be used in screening methods such as those using DNA chips. The present sequence is also useful as a target to screen therapeutically useful modulators
                                                                                                                                                                                                       Factor 8 treating
                                                                                                                                a coagulation cofactor which is selectively expressed in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human; Factor 8 Homologue; F8H;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                mannan-binding lectin (MBL) associated serine protease-2 (MASP-2) for producing a pharmaceutical composition. MASP-2 is a complement fixing enzyme and involved in lectin pathway of complement activation. The pharmaceutical composition comprising MASP-2 is useful for treating infections caused by microbes such as fungus, yeast, retrovirus (e.g. human immunodeficiency virus (HIV)), or pathogenic bacteria which are resistant to at least one antibiotic medicament or multiresistant. The polynucleotide encoding MASP-2 is useful for treating patients deficient in MASP-2. The invention also discloses MASP-2 assays which are useful for determination of MASP-2 activity or levels in patients suffering from e.g. infections, inflammatory disorders and spontaneous recurrent abortion. The pharmaceutical composition multiplication of the pharmaceutical composition is useful for treating inflammatory
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Key

                             levels in patients suffering from e.g. infections, inflammatory disorders and spontaneous recurrent abortion. The pharmaceutical composition comprising MASP-2 inhibitor is useful for treating inflammatory disorders. The present sequence is human MASP-2 protein. Note: The present sequence is stated as being the same as SEQ ID NO:2 shown in figure 6 of the specification (AAEI4564). However the sequences differ at various locations.
                                                                                                                                                                                          mannan-binding lectin (MBL) associated serine protease-2 (MASP-2) for producing a pharmaceutical composition. MASP-2 is a complement fixing enzyme and involved in lectin pathway of complement activation. The pharmaceutical composition comprising MASP-2 is useful for treating infections caused by microbes such as fungus, yeast, retrovirus (e.g. human immunodeficiency virus (HIV)), or pathogenic bacteria which are resistant to at least one antibiotic medicament or
                                                                                                                                          multiresistant. The polynucleotide encoding MASP-2 is useful for treating patients deficient in MASP-2. The invention also discloses MASP-2 assays which are useful for determination of MASP-2 activity or

C;Comment: Clr is a dimer of identical chains, each of which is activated by cleavage in
A;Camment: While fragment gamma remains disulfide-bonded to the B chain to form Clr II.
A;Camment: This protein is a serine protease that combines with Clq and Cls to form Cl,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              R;Thielens, N.M.; Aude, C.A.; Lacroix, M.B.; Gagnon, J.; J.                                                                                                                                       PRESENCE OF CALCIUM.

SUBUNIT: HETERODINER, CONSISTING OF HEAVY AND LIGHT CHAINS WITH DISULFIDE BONDS. THE HEAVY CHAIN IS EXPECTED TO BE A REGULATORY SUBUNIT AND THE LIGHT CHAIN CONTAINS THE CATALYTIC SITE.

DOMAIN: THE GLU-RICH REGION IN THE N-TERMINAL REGION MAY BE GAMP.

CARBOXYLATED AND FUNCTION AS A CALCIUM-BINDING SITE.

SIMILARITY: TO BLOOD COAGULATION FACTORS SUCH AS IX, X AND AN ANTICOAGULATION FACTOR, PROTEIN C.

SIMILARITY: BELONGS TO PEPTIDASE FAMILY SI.

SIMILARITY: CONTAINS 2 SUSHI (SCR) DOMAINS.

SIMILARITY: CONTAINS 2 CUB DOMAINS.

SIMILARITY: CONTAINS 1 EGF-LIKE DOMAIN.
